Hereby offsets 493 ton CO₂e for emissions arising from kunder 2024. The emissions are offset through trädplantering in the project UpperTana

The Upper Tana Nairobi Water Fund Trust (UTNWFT) runs this project operating in a catchment area north of Nairobi, Kenya. This project works with approximately 169,000 smallholder farmers to better manage their land in exchange for performance-based payments. After a visit from UTNWFT, farmers are supported in making a farm-specific action plan where the most impactful measures are discussed and then implemented. Various species are planted for different purposes, for example napier grasses stabilize the land to prevent run off while native tree species support biodiversity and generate carbon payments.
